Welcome back to the Python Course

What we learned

- Variables
- Conditional Operators
- Loops
- Lists and Dictionaries

Project

Today you are creating your own project!

This project includes all your knowledge acquired up today.

Project Examples

Maybe you are creating software for a delivery company. Display a list of items on the screen. When a registered user makes a purchase, a new order is saved in a list.

Project Examples

Maybe you are creating software for a store. You can input new items for sale in one (or more) dictionaries. You can retrieve the price or the quantity of remaining items by using the item name. The program alerts you if an item is out of stock.

Project Examples

Maybe you are creating a hangman game. The opponent inputs the secret phrase. Then, you attempt to guess the phrase one letter at a time. You can also attempt to guess the phrase directly. The program verifies whether the entered letter is allowed or has already been used.
